...even types of fraud Chip and PIN was supposed to prevent

Card-not-present: up 22% to £301m
Lost and stolen: up 7% to £58.9m
Counterfeit: up 3% to £43.4m

within total fraud figures

UK retail face-to-face: up 11% to £60.8m
UK cash machine: up 10% to £31.9m
Chip and PIN transactions have three main stages

- **Card authentication**: card proves it is real through providing a digital signature that the terminal can verify

- **Cardholder verification**: card and terminal check that legitimate cardholder is present (normally by card verifying the PIN)

- **Transaction authorisation**: terminal checks with bank that previous steps have been followed and the transaction should proceed
Card authentication

1. Card details; digital signature
2. PIN entered by customer
3. PIN entered by customer; transaction description
4. PIN OK (yes/no); authorization cryptogram
5. Online transaction authorization (optional)

Criminals have successfully bypassed Chip & PIN

Obtain static data as a result of flawed tamper resistance in Chip & PIN terminals

then

Bypass card authentication through exploiting backwards compatibility mode

Steal cards

then

Bypass cardholder verification by exploiting Chip and PIN protocol flaws

Counterfeit

Lost and Stolen
Sensitive data is sent unencrypted between the card and the terminal

- Card number, expiry date, cardholder name …
- Copy of magnetic stripe including CVV (for some cards)
- PIN to be checked by card

Chip and PIN terminals are supposed to protect this information against being recorded: tamper resistance
Tamper switches
Tamper mesh
Criminal gets all that is needed to make a magnetic stripe card

- Card number, expiry date
- CVV
- Cardholder’s PIN

Compromising a shop terminal now gives criminals enough information to make ATM withdrawal
Criminal gets all that is needed to make a magnetic stripe card

- Card number, expiry date
- CVV
- Cardholder’s PIN

Chip and PIN led to increase in counterfeit fraud.
Card is responsible for cardholder verification

- Card states ways by which cardholder verification can be performed and the preference (e.g. first PIN, then signature)

- If PIN used, terminal sends PIN to card and card checks if correct

- PIN sometimes encrypted

- Response **not encrypted or authenticated**
VISA
Enter PIN

£5.00

CWL = NO
ENT = OK
The no-PIN attack

1. Card details; digital signature
2. Wrong PIN entered by crook
3. Wrong PIN entered by crook; transaction description
4. PIN OK (yes); authorization cryptogram
5. Online transaction authorization (optional)
Response from industry

What is more, at this stage, the observations are the result of scientific research whose transposition outside laboratory conditions is complex since it would necessitate the use of highly sophisticated material.

— Le GIE des Cartes Bancaires (January 2010)

Neither the banking industry nor the police have any evidence of criminals having the capability to deploy such sophisticated attacks.

— UK Cards Association (February 2010)
L'imparable escroquerie à la carte bancaire

Un dispositif permettant de neutraliser la sécurité des puces des cartes bancaires a été utilisé pour la première fois en France. Plusieurs escrocs ont été arrêtés, mais cette arnaque n'a toujours pas de parade.

Publié le 24.01.2012

Des escrocs, particulièrement expérimentés, sont parvenus à contourner la sécurité de la puce incorporée aux cartes bancaires — réputée inviolable —, avant de multiplier les arnaques. La technique employée — mise au jour en 2010, par un universitaire anglais, le professeur Ross Anderson — a été appliquée pour la première fois en France par une équipe établie en région parisienne et dans le Nord. Plusieurs d'entre eux viennent d'être interpellés par les enquêteurs de l'Office central de lutte contre la criminalité lié aux technologies de l'information et de la communication (OCLCTIC). Selon les premiers éléments de l'enquête, les malfrats ont réalisé près de 6000 achats pour un préjudice de plus de 500 000 €.

Les policiers craignent de voir cette technique se répandre. « Pour l'heure, même si la personne qui s'est fait voler ou qui a perdu sa carte fait opposition sur cette dernière, les escrocs peuvent, malgré tout, continuer à s'en servir, note un policier spécialisé. C'est tout le problème de cette menace. »

Avez-vous confiance en votre carte bancaire?
The unstoppable credit card scam

A device to neutralize the security chip bank card was used for the first time in France. Many scammers have been arrested, but this scam still does not have a parade.

Published on 24.01.2012

Crooks, highly experienced, have managed to bypass the security chip embedded bank cards - deemed inviolable - before multiplying scams. The technique - unearthed in 2010 by a British academic, Professor Ross Anderson - was applied for the first time in France by a team based in the Paris region and in the north. Many of them have just been arrested by investigators from the Central Office for the Fight against Crime related to Information Technology and Communication (OCLCTIC). According to preliminary investigation, the thugs have made nearly 6,000 purchases for damages of more than €500,000. Officers fear that this technique spread. "For the time being, even if the person who was stolen or lost card opposed to the latter, scammers may nevertheless continue to use it, says a specialist officer. That's the whole problem with this scam. Thieves rajaonten on the map stolen a second chip that tricks the payment terminal at the merchant, into believing that the PIN is the correct compound. The perpetrator should not exceed the amount of €100 at which a payment authorization is satisfied, in order to give the impression of the real owner of the card", explains a source familiar with the case. The scammers used the device to make purchases at places such as supermarkets, jewelers, and clothing stores.

Crooks, highly experienced, have managed to bypass the security chip embedded bank cards - deemed inviolable - before multiplying scams. The technique - unearthed in 2010 by a British academic, Professor Ross Anderson - was applied for the first time in France by a team based in the Paris region and in the north. Many of them have just been arrested by investigators from the Central Office for the Fight against crime related to information technology and communication (OCLCTIC). According to preliminary investigation, the thugs have made nearly 6,000 purchases for damages of more than € 500,000. Officers fear that this technique spread. "For the time being, even if the person who was stolen or lost card opposed to the latter, scammers may nevertheless continue to use it, says a specialist officer. That's the whole problem with this scam. Thieves rajoutent on the map stolen a second chip that tricks the payment terminal at the merchant, into believing that the PIN is the correct compound. The perpetrators should then not exceed the amount of € 100 at which a payment authorization is requested to the bank. But below this amount, the purchase is always accepted. "Investigators
1. Scammers steal bank cards by stealth to avoid attracting the attention of their victims too quickly.

2. They then modify the card, replacing existing chip with another, programmed with software that blocks the security.

3. The scammers can then enter any PIN to pay for purchases costing less than €100.

4. The scammers are buying, in general, consumer products that can be quickly sold on black-market.

EMV-CAP in the UK
EMV CAP’s weakness: attacker controls user experience

- User thinks they are typing random challenge but it is really part of an account number
- User thinks it’s OK that details on device don’t match those they entered on the computer
- User thinks they are performing a POS transaction but really it’s online banking
Usability is a security requirement
